

Fish Passage Around Weirs

There are a couple of small weirs in the drainage that we're planning on providing fish passage around through removal of the weir (Porter Fork) or through building up the stream channel in a stepwise fashion (Log Haven) as part of this restoration effort. One weir is in Porter Fork just upstream from where it runs into Mill Creek. A second weir is located on private property at Log Haven. The Weir at Log Haven was corrected in the fall of 2015. Others may be identified as the project proceeds.

The Porter Fork Weir

Log Haven Work

Work at Log Haven in Mill Creek, Salt Lake County, Utah to reduce barriers to Bonneville Cutthroat trout migration. Part of the Mill Creek Watershed Restoration effort. This work was completed in the fall of 2016. Through a grant from National Forest Foundation to Salt Lake County, this weir was left in place to maintain a stable stream bank and the stream channel was built up to allow fish to pass over the structure.

Photo of the diversion weir located on a private lands in Mill Creek adjacent to the Uinta-Wasatch-Cache National Forest, 2012.

Photo of the diversion weir after the project was completed. Work included raising the stream bed to provide fish passage over the weir, and planting willows to improve riparian vegetation. The project is located on a private land in Mill Creek adjacent to the Uinta-Wasatch-Cache National Forest, 2015. The project was completed in November 2015 through a contract managed by Salt Lake County.
